

Which Class Did Better?

Topic 1.9 · TODAY'S PROBLEM

Two AP Statistics classes took the same 40-point quiz. The side-by-side boxplots show the scores. Two students read them differently.

Sam: “Period B did better — its highest score is 40 and Period E’s is only 38.” **Tia:** “Period E did better — its median is higher and its scores are more consistent.”

FIRST TAKE (5 min, on your sheet)

Which class did better on the quiz? One sentence, and name ONE feature of the plot you used.

- DOK 1** (a) Read off the median and the maximum score for each class.
- DOK 2** (b) Compare the two distributions of quiz scores in context. Use comparative language (higher / lower, more / less variable) and address center, variability, shape, and any unusual features.
- DOK 3** (c) Whose claim is better supported, Sam’s or Tia’s? Cite two specific features of the boxplots that settle it. Then: if you could report only ONE statistic per class to a parent asking ‘how did the class do?’, which statistic would you choose, and why that one rather than the maximum?
