One Plot, Two Reporting Strategies

AP Statistics · Topic 2.4 (CED 5.1) · B: 2027-02-05 · E: 2027-03-31

[STAR] TODAY'S PROBLEM

Suppose a test kitchen measures dough volume for ten batches at assigned times after mixing. The scatterplot shows the paired measurements.

Jules: Use a straight-line summary because volume generally increases with time. Treat the 50-minute batch as ordinary variation.

Ravi: Decide the form from how the rate changes, and report the 50-minute batch separately if it departs from nearby values.

FIRST TAKE — before the video (5 min)

Which reporting strategy seems more defensible, Jules's or Ravi's? Cite one graph feature.

[BOOK] BUILD A COMPLETE SCATTERPLOT DESCRIPTION (keep on the page)

Put the explanatory variable on the x -axis and the response on the y -axis. Describe direction, form, strength, and unusual features in context. Linear form has an approximately constant rate; nonlinear form may curve or change rate. Report an unusual point without letting that one point erase the pattern followed by the rest.

Finish after the video:

DOK 1 (a) Identify the explanatory and response variables, assign them to axes, and interpret (30, 650).

DOK 2 (b) Find the volume changes from 0 to 20 and 70 to 90 minutes. Compare the 50-minute volume with the midpoint of the 40- and 60-minute volumes.

DOK 3 (c) Choose a reporting strategy. Use direction, form, strength, both changes, and the 50-minute comparison to write a complete description. Explain how the rejected strategy could distort a later-growth decision.

Frame: The changes of _____ mL and _____ mL support a _____ form because _____.

Frame: I choose _____; the 50-minute value is _____ mL from its local benchmark, so _____.

EXIT — turn this in

One thing the video changed about my first take: _____
