Same Data, Different Bins

AP Statistics · Unit 1 · Topic 1.5 · B: 2026-09-15 · E: 2026-09-18

[STAR] TODAY'S PROBLEM

Suppose a student recorded steps for 30 days. Histograms F and C show the same data with 1-thousand- and 5-thousand-step bins. A coach asks, “Does this student move differently on school days and weekends?”

Priya: “Use C. F has too many short and empty bars; C gives the clearer summary.”

Leo: “Use F. C combines values that should not be treated as one group.”

FIRST TAKE — before the video (5 min)

Which histogram is more useful to the coach, F or C? Name one visible feature.

[BOOK] READING HISTOGRAMS (keep on the page)

A histogram bar counts the observations in its interval; adjacent bars touch because the horizontal axis is quantitative.

Changing bin width or bin boundaries changes what is **visible**, not the observations themselves. Narrow bins can expose **clusters, gaps, and isolated values**; wide bins can make broad counts easier but can merge those features.

Choose a bin width for the question. A one-variable histogram can suggest distinct groups, but it cannot identify which observation belongs to which group unless the group labels are retained.

Finish after the video:

DOK 1 (a) State each bin width and the number of days in F's 19–20-thousand interval.

DOK 2 (b) Describe F in context, including clusters, gaps, and the unusual value, with units.

DOK 3 (c) Adjudicate Priya's and Leo's recommendations. Choose the better first look for the coach, cite a feature that vanishes in the other display, and explain what its reader could wrongly conclude. State what information is still needed before naming either cluster school days or weekends. Give one specific question for which C is better.

Frame: I would show histogram _____ because it preserves _____, while the other merges _____.

Frame: Before naming day types, I need _____; C is better when the question is _____.

EXIT — turn this in

One thing the video changed about my first take: _____
