Example board — project this first

A claim no card uses, so nothing is given away. Every poster has a title, the claim and the data, then the five things on its checklist.

1 · TITLE

"Healthy people hate flying"?

2 · THE CLAIM

"Healthy people hate flying: only 14 of them chose Fly."

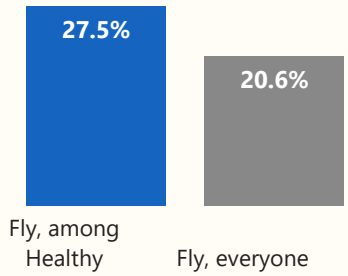

3 · THE DATA IT RESTS ON (FROM THE SUPER STATUS TABLE, 433 STUDENTS)

Students who want to be Healthy: 51. Of those, chose Fly: 14. Students who chose Fly overall: 89 of 433.

4 · THE PROBABILITY THE CLAIM DEPENDS ON

P(Fly | Healthy) = 14/51 = 27.5% compared with **P(Fly) = 89/433 = 20.6%**. The word "Healthy people" names the given group, so 51 is the denominator, not 433.

5 · THE VISUAL

6 · VERDICT (THE FRAME)

The claim says Healthy people hate flying. The number it really depends on is P(Fly | Healthy) = 27.5%, not the count 14. So the claim is **not supported**, because the Healthy group is small (51), and they chose Fly MORE often than students overall (27.5% vs 20.6%).

7 · REPAIR

"Students who want to be Healthy chose Fly more often than the class overall: 27.5% vs 20.6%."

Names and roles: Table Keeper ___ · Visual ___ · Writer ___ Must-haves ticked: ☑ ☑ ☑ ☑ ☑

Talk-track (3 minutes)

1. "Read the claim. Which word names a group? *Healthy people*. That group's total goes in the denominator: 51, not 433."
2. "Now compare: inside the group, 27.5%; everyone, 20.6%. The claim is backwards. That is the verdict, and the proof is the two numbers."
3. "The repair is a true sentence with the percent in it. Your poster needs a title, the claim and the data, then the five things on your checklist. The checklist is the rubric."
