

Same Counts, Different Message

Unit 1 · Topic 1.4 · THE PROBLEM

Suppose 184 students chose a favorite lunch option. A newsletter printed **Graph A** with the headline “**Pizza wins by a landslide.**” A council member redrew the data as **Graph B** and said, “It is basically a tie.”

FIRST TAKE — one sentence before you work the parts

Is pizza clearly the favorite? Name the graph that most influenced you.

- DOK 1** (a) Read the Pizza and Pasta counts. How many more students chose Pizza?
- DOK 2** (b) Graph A starts at 40. Find the visible heights above 40 for Pizza and Pasta. Compare those heights with the actual counts.
- DOK 3** (c) Which graph gives a fairer picture of the lunch votes? Explain how its scale affects the comparison. Use your counts to judge both ‘landslide’ and ‘basically a tie,’ then write a more accurate headline.

Self-paced bonus problem. Work (a)–(c) from this sheet; turn it in whenever you finish.
