Describing a Distribution

AP Statistics · Topic 1.6 (CED 1.6) · B: 2026-09-17 · E: 2026-09-21

[STAR] TODAY'S PROBLEM

The histogram shows how long it took 40 students to get to school one morning, in minutes. Two students described the distribution.

Ana: “Roughly symmetric, centered near 20 minutes, spread from 5 to 45 minutes.”

Ben: “Skewed right with a peak in the 10–20 minute interval; most students take under 30 minutes; one student at about 70 minutes is an outlier.”

FIRST TAKE — before the video (5 min)

Whose description do you trust more, Ana's or Ben's? One sentence. No wrong answers yet.

[BOOK] DESCRIBING A DISTRIBUTION (keep on the page)

Shape (symmetric / skewed left / skewed right; one peak or two) · **Center** (median or mean) · **Variability** (range, IQR) · **Unusual features** (gaps, outliers, clusters) — always **in context, with units**.

A long tail pulls the **mean** toward it; the **median** resists. “Skewed right” means the *tail* points right, not the peak.

Finish after the video:

DOK 1 (a) Name the shape of the histogram and state which interval contains the median commute time.

DOK 2 (b) Describe the distribution of commute times in context. Address shape, center, variability, and any unusual features, with units.

DOK 3 (c) Whose description could a reader trust when choosing a summary statistic? Cite two specific features of the graph that settle it. Then state which measure of center you would report for these data and why.

Frame: I would report the _____ because the distribution is _____, so the _____ is pulled toward _____.

EXIT — turn this in

One thing the video changed about my first take: _____

Optional #1 — not collected

DOK 2 Sketch a dotplot of 15 quiz scores (0–10) that is skewed LEFT, unimodal, and has one low outlier. Then write the one sentence a reader would need in order to describe it in context.
